

Enriching lifestyles with Information Technology

Recruit Institute of Technology (RIT) is the technology hub and research lab for Recruit Holdings, a company that provides over 200 online services in the areas of human resources, travel, housing, restaurants and many other areas in which people make daily lifestyle decisions.

We conduct research in several areas, including natural language processing, machine learning, artificial intelligence, data management, and data integration. We collaborate with universities and publish in top-notch conferences.

Example Projects:

NLP for search engines: RIT is developing natural language processing techniques to improve the understanding of queries that users pose to vertical search engines and the textual content these engines store through conversational interfaces.

Chatbots: we are developing tools for easily building chatbots in vertical domains, including how to pose questions and extract answers and finding natural conversation flows.

Joybot: we are fielding our NLP technology in Joybot, a conversational agent that helps users set goals for increasing their happiness.
